Predefined Functions

E Pluribus Unum

Autore Ignoto, Moretum, I sec. a.C.

- Why we need functions?
- C standard library
- Predefined functions
 - Anatomy of a function

SUMMARY

- A function is a **group of statements** that, together, perform a given task
 - i.e. performing something **more complex** than “simple” C instructions
 - All high level programming languages have the concept of “function”
 - Every C program features at least one function → `main()`
- In C we also have macros, but we won't talk about them

Why we want to use them?

- **Factorization:** a function is defined once but can be used countless
 - Reusable code
 - Reduce code size → greater efficiency
- **Ease of modification:** redundancy is reduced
 - I modify/improve/correct code in one place
- **Better readability:** code details can be isolated
 - The use of functions can be self-explanatory
 - Breaking the code in smaller functions, makes it more readable and structured

Software levels

Two types of functions

C Functions

```
graph TD; A[C Functions] --> B[Built-in Functions]; A --> C[User-defined Functions];
```

Built-in Functions

```
printf()  
scanf()  
malloc()  
rand()  
...
```

User-defined Functions

Two types of functions

C Functions

```
graph TD; A[C Functions] --> B[Built-in Functions]; A --> C[User-defined Functions];
```

Built-in Functions

```
printf()  
scanf()  
malloc()  
rand()  
...
```

User-defined Functions

- Function already available that are provided by the C library
 - Input/output: printf(), scanf()...
 - Math: sqrt(), cos(), sin()...
 - Time/Dates: time()...
 - Memory management: not yet discussed
 - String/Character: not yet discussed
 - Other: rand(), srand()...
 - ...

- Do not reinvent the wheel!
- The *C Standard Library* enable us with a lot of useful functions
- Anyway
 - We need to know what functions are provided...
 - Include a specific header
 - Use them!
 - This also implies we need to know how to use them

- `stdlib.h` → general use (I/O, memory, data types...)
- `string.h` → string management
- `math.h` → mathematical functions
- `time.h` → time and calendar management
- `ctype.h` → characters inspection and management

- When we look at any C manual we can find a function description
- and a function “signature”, something like:
 - `int rand(void); void srand(unsigned int seed); double sqrt(double x);`

Type of data returned
by the function
(int, float, char...)

Function name

Formal parameters
list

`<return type>`

`<function name>(<formal param1>, ...);`

C99 Albero dei Tipi di Dato

- It is a *no-type*
- We can not use *void* to define variables
- Used for
 - Functions
 - No value
 - No parameters
 - Pointers (we will see them later, spoiler: initially you will not like them)
 - No type

- What we need to “use” it
- Again remember that lower case $\neq$ upper case

Function name

`<return type>    <function name>(<formal param1>, ...);`

- It allows us to understand which type of data the function provides
 - `int rand()`, `double sqrt()`, **`int`** `abs()`
- Not all functions return something
 - `void srand()`

Type of data returned
by the function
(`int`, `float`, `char...`)

`<return type>` `<function name>(<formal param1>, ...);`

- Many functions needs some data as input
 - `double sqrt(double x);`
- Sometimes more than one parameter → comma is used
 - `double pow(double x, double y);`
- Or even nothing
 - `int rand(void);`

Formal parameters
list

`<return type>    <function name>(<formal param1>, ...);`

- A good manual also point us which header file is needed

exit *Exit from Program*

<stdlib.h>

```
void exit(int status);
```

Calls all functions registered with `atexit`, flushes all output buffers, closes all open streams, removes any files created by `tmpfile`, and terminates the program. The value of `status` indicates whether the program terminated normally. The only portable values for `status` are 0 and `EXIT_SUCCESS` (both indicate successful termination) plus `EXIT_FAILURE` (unsuccessful termination).

9.5, 26.2

- The knowledge of the function signature is all what we need to use them

```
x1 = (-b + sqrt( pow(b,2) - 4*a*c )/( 2*a );
```

```
x2 = (-b - sqrt( pow(b,2) - 4*a*c )/( 2*a );
```
